An Explanation of the aspects of this CAP Events Terms list rationale. See note 73

1) There are four basic modes of distribution of these messages:

A) Broadcast radio and Television.

B) WEA (Wireless Emergency Alerts, a cell broadcast technology).

C) CAP messages to others e.g. alerting providers, jurisdictions with their distribution using SMS messaging, ETN (Emergency Telephone Notification), email and others.

D) Some countries are using SMS messaging, but this is a message per recipient method and people may not be signed up or the volume of messages may result in extreme delays or overload with messages lost.

E) Satellite radio and TV. These distributions cover large areas. There may be a considerable amount of alert messages, so a prioritization scheme for delivery is important. This would be better than a First-In-First-Out queue.

F) Cable and Fiber radio and TV. These systems have the receivers within the design control of the company. The improvements here (e.g. prioritization) are things they could incorporate to improve the user experience. The SCTE has a transmission standard that could carry CAP messages.

2) The methods of distribution are changing. Integration with other standards such as ATSC 3.0 A/331, the basis of AWARN/AEA. Digital radio (HD Rad

A) Broadcasting is increasingly using digital radio, which makes possible data distribution and selective distribution. TV is almost completely digital. Both currently override the program audio without selective distribution. TV is moving to using the LDM (Layered Division Multiplexing) modulation that includes a high power, low data rate content that has greater range to TV antennas or to small antennas in cellphones. This LDM would carry the alerting audio and data.

B) WEA is moving to LTE and 5G transmission and from a 90 character limit to a 360 character (USA) or 700 character (Canada, with 2 languages). The recommendation I made for the European Commissions' DRM 2020 was to have 740 characters, and allow 2 or more languages with each language having at the beginning <lngEAS> first language code and the EAS 3 character code then each language division a <///lng> the language code followed by the language. Swtizerland may find that most messages could carry three languages. There are P and C codes in the WEA column. Others MAY be included for example based on priority levels.

3) Implications of changes

The A) with LDM being received by mobiles provides for two possible sources of messages. Currently there is no coding to recognize the two versions of the same origin message. This can comtribute to alert fatigue, a serious problem. So WEA SHOULD include at least the EAS 3 character code if not the messageID.

4) Broadcasting message delivery

Almost all radio stations and all TV stations have their program content playout or transmission switching under the control of an automation system. Currently the automation system has no control of the emergency message encoder/decoder. The only mode of message insertion is either overriding the program content, or waiting for an operator to manually control the automation and insert the message. With many radio stations and some TV stations being unmanned, the manual insertion becomes unavailable. As the legal requirement is to only deliver the Emergency Activation Notification and Required Monthly Tests, a number of broadcasters avoid the unwanted overrides and not transmit them. Having selective message delivery only to selected recipients, and a prioritization scheme for each Event Term makes possible an acceptable autimation solution.

Automation systems time all the content. With TV the time increments are normally in multiples of 15 seconds. This includes live events. Announcers may have teleprompters, but are also trained to compose the text and deliver it with timing which should be accurate to within about a second. This may be news on location. This looks simple when you watch it, but not really. Exceptions are Daylight Saving time change, leap seconds and Emergency Alerts at present. The former have prearranged content schedule change. Elergency Alerts, if they are not timed to the 15 second multiple SHOULD have some suitable filler material to play out for the rest of the time duration. Priority 1 and 2 being overrrride, may not be accompanied with a duration value, but these also SHOULD be timed. Radio broadcast may operate with smaller timing increments, perhaps 5 seconds, dependng on the automation system and playlist timing input. Both priorities without Override for most messages and selective message delivery are very important for the improved system to be considerably better than the current EAS, which is really unacceptable to broadcasters currently. 3 & 4 have a 7 minute override timeout, 5 & 6 have a 14 minute overrride timeout, 7 & 8 have a 21 minute override timeout, 9 has a 28 minute override timeout. Having CAP priority as URGENT reduces the number by one, except for 1.
The Pacific Tsunami Warning Center issues tsunami warnings. Some of these are assessed as;
EVALUATION
---
* AN EARTHQUAKE WITH A PRELIMINARY MAGNITUDE OF 6.7 OCCURRED IN
THE RYUKYU ISLANDS, JAPAN AT 1551 UTC ON SATURDAY JUNE 13
2020.
* BASED ON ALL AVAILABLE DATA... THERE IS NO TSUNAMI THREAT
FROM THIS EARTHQUAKE.
RECOMMENDED ACTIONS
---
* NO ACTION IS REQUIRED.These SHALL be relayed as STATEMENT if relevant.

Because of the unacceptability of EAS to consumer electronics manufacturers, there has been manufactured a range of radio receivers called "Public Alert certified" which are available on the internet, but are generally not available in electronics stores. The added feature cost is significant compared with the benefit, which is an issue to consider.

	Warnings would have a higher priority than an advisory, and even lower would be a statement. This is the reverse of the number value as described below. This means there are more terms to provide for that distinction. Sometimes Statements are used for "Return OK or All Clear" messages. These are important The term Watch is only used once, so for simplification and translation accuracy, this word would be replaced with Advisory.	NOT FOR Standard, but FYI. Priority scheme is very important.
5) Message reception user interface		
	With a prioritization scheme that is simple to understand, it then can also be made use of by recipients. The scheme operates like a "Alert Volume Control" with 1 being the least, for the most important alerts, to 9 being the most alerts. Then 0 is for special cases such as School Closing (e.g. winter storm) that are only transmitted by selected radio stations, or advertisements variations. The default setting in the receiver would be a 5. Most people would leave this as it is.	NOT FOR Standard, but FYI. Priority scheme is very important.
6) Comments and deletions of Event Terms		
	The terms that are equivalent, but for different categories e.g. Health, Safety, would be merged with combined categories. Some terms are for Press Release purposes e.g. Multiple Alarm Fire. This is explained in Wikipedia. Normally these are the statement version of an alert. Coastal Flood and Storm Surge are essentially the same thing, so are placed next to each other. Sinkhole and karst are essentially the same thing but the word selected varies by country, so both are kept next to each other. Dam burst, flash flood and lahar have different causes, but the effect is about the same. So they are kept together. As Flash Floods cause a significant loss of life, a Flash Flood Emergency is added as a D message for future selective delivery. The term water hazard applies to potable water, so potable is added. Earthquake and missile countdowns are triggered by seismometer networks or ABM radar, but both would make use of the same counting code in the receivers. 10 "delete" items remain which may have a comment added.	
Arbitrary Sorting		
	This column may be removed. However the CAP Language table with language to column reference would need reindexin	
Importance of valuable public information		

	According to Daniel Aldrich and Michinori Watanabe at https://www.npr.org/2011/07/04/137526401/the-key-to-disaster-survival-friends-and-neighbors and Eric Auf de Heide "Common Misconceptions about Disasters: Panic, the "Disaster Syndrome," and Looting https://www.atsdr.cdc.gov/emergency_response/common_misconceptions.pdf. The rescue of individuals by neighbors, relatives and friends in a disaster appears to be in the range of 40% to 80%. The balance being by First Responders. Therefore information to assist this public effort can be very valuable for a low cost. One form of such assistance can be by push publishing of helpful information files. In the Notes+ section is a list of file types that could be push published by digital radio or TV to computers or cellphones. In a disaster there is quite likely to be a shortage of First Responders. If EDXL-DE is used, other file types may also be distributed.
Term Values Flexibility	
	The values assigned to the Event Terms are recommendations. The values MAY be modified based on actual experience and the observation of errors. After ITU adoption, this MAY be for a national or international region version. The changes SHOULD NOT have any effect on receiver processing.
Templates and TTS (Text To Speech)	
	Having adequate detail in the Event Terms list would assist in the preparation of message templates that can be populated with details. Also such message templates may include phonetic characters to assist pronunciation of messages which are originated with TTS. That is important as there may not be announcers available in anemergency.
Items at the right	
	The rightmost columns have a number of functions. There are Notes, which are on a separate sheet There are Pix which are icons on the notes sheet There is an explanation of fire weather condition relating to Event Terms on another sheet
	Broadcast alerts may be Analog or Digital-only. O means Override, the former Analog-only mode where the original EAS only had the option to override program content. Opt-out may be possible. D means that the alert is carried separately from the program content and the alert can be opt-in selection The authorization level is noted, and is a suggestion for a subject to be addressed. A good default scheme would be helpful and countries or regions would be free to implement their detailed version.

Heartbeat	This is a regular (6 second default) message identifying whether the broadcaster is transmitting full or partial digital alerting capability. Also information as to adjacent stations carrying the same capability, content and their callsign, frequency and location. This enables the receiver processor to select the best alert message delivery station when the user is listening to another source like satellite or a player. Alerting is still possible then. As a driver takes a long trip, the radio can automatically tune to another station when the original station signal fades out. About 85% of radio listeners are in vehicles. They may have navigation so the latitude and longitude of the receiver can be used for selectivity and such automatic selection of another station.		
Unexplained Reason Terms	A number of terms that have been in use in EAS are directions that do not give a reason for acting. The text may do so, or may not. The Emergency Manager may consider that this is not information to be provided at this time. These terms are;		
	curfew (home or hotel)	safety hazard	Safety
	evacuation immediate	safety hazard	Safety
	evacuation rapidly	safety hazard	Safety
	local area emergency	safety hazard	Safety
	protective clothing required	safety hazard	Safety
	return OK	safety hazard	Safety
	shelter immediately	safety hazard	Safety
	shelter in-place	safety hazard	Safety
	state or province activation	safety hazard	Safety
Yellow Alert, hit & run driver	Some States have implemented legislation for hit & run alerts. These may be displayed as yellow alert.	safety hazard	Safety
Travel Advisory Terms	These are numbered 1-4 as used by the U.S. State Department. A term 5 is added as desirable in the current pandemic. Also ATC0 has been used in the past and that is provided for here.	health issue or safety hazard	health/Safety
Volcanic Explosivity Index	or Risk index which is used in New Zealand. This is explained in Wikipedia. For definition flexibility 0 to 9 are provided.		
Nuclear INES	This is explained in Wikipedia		
Diseases			

	They may be communicable, contagious or interspecies zoonotic. These do not always translate into different terms. Improved language definition for those languages is desirable.			
Local system alerts				
	City/County/Borough Activation. Not for WEA, EAS or AEA messages, may be political. Not for distribution on State or National alerting system.	civil	(reserved local code	
Space CME (Corona Mass Ejection)				
	Solar flares are a hazard to power and communications wires, and satellites.			
Refugees				
230		civil	refugee	
Indonesian and Malay				
	These adjacent countries have very similar languages. The combining of the terms is a suggestion for better cooperation between them. They also share disasters e.g. the 2004 tsunami.			
Kurdestani				
	They are replacing their cyrillic alphabet with a latin one. The translations may not be accurate.			
Mongolia				
	This country is replacing the cyrillic with a unique script. Computer translation is not currently available.			
Unrecognized Emergency, Statement, Advisory or Warning				
	These are not transmitted alerts. They are for future code flexibility provision in receivers as part of EAS where there may also be errors in the data. They are assigned CET-000			
Hurricanes, cyclones and typhoons				
	These three English names are basically the same weather phenomena but with different names, locations and directions of rotation. The codes and categorization for all of them are made the same, but how to arrange the cyclones and typhoons in this Event Terms list may be preferred to differ from how it is arranged here.			
Some deleted terms;				
55		civil issue/concern/	~~law enforcement watch~~	watch
22		aviation hazard	airspace r	advisory
42		civil issue/concern/	civil inform	statement

76	Mercalli earthquake alert 1-9	earthquake	~~earthquake alert #1~~	alert
84	Mercalli earthquake alert 1-9	earthquake	~~earthquake alert #9~~	alert
88.1		earthquake	~~earthquake emergency~~	
56		civil issue/concern/	~~local area statement~~	statement
172		infrastructure issue	railway, train accident	
280		state, province	state or province Information emergency	
89		earthquake	~~warning~~	warning
69		infrastructure issue		advisory
133	CET-249 old number	~~hazardous weather~~	~~statement~~	statement

177	CET-232 old number	infrastructure issue	traffic advisory	advisory
187	CET-141 old number	marine	pest	
275	CET-141 old number	special marine		warning
185	CET-141 old number	marine	disease	
278	CET-249 old number	special weather		statement

Not deleted but similar to another

172	CET-177 (similar to other CET-177) old number	infrastructure issue	railway, train accident	

Sort WARNING

Performing a sort on a column of the terms MAY result in columns on the right not being sorted, but just left as is. This was observed using Windows 10 with Office365 Excel with a 32 GB memory. The columns beyond MY had to be hand sorted.

Translation Tests

For after translators have checked computer translations

1. What is the automation priority and urgency for a landslide that is observed? Does that need correction?
2. What is the automation priority for a tsunami that is detected as originating from a nearby location and expected within one hour or less?
3. May a tsunami as in 2 above, or an earthquake, or a landslide as in 1 above be able to override a National Activation from a President or Prime Minister, in selected areas, with that National Activation message repeated in those areas after the overriding message? This is a recommendation, but needs the appropriate legislative approval in order to be mandated in each country.
4. Do the translation of ""communicable disease" and "contagious disease" get clear identification separately in the translation?
5. Are the fire risk levels for forest or wildfires suitably identified by level and color code for the language of the countries being used in? There are different schemas that are combined, but "Red Flag" is not recommended.
6. When moderate or mild weather has an urgency that is Past, does that mean it has ended and something else begun, or does it mean that the moferate or mild weather has begun?

7 The Fire Alarm number 1 to 5 scheme is defined in the U.S. This may need redefinition for other countries, using the same numbers. Is this needed?

8 The cyber crime and internet issue terms may need redefinition for various countries in various languages. Is this needed?

9 The provision for State Governors to issue alerts is provided for. Is this legal for the language in the locations this translation is to be used?

ɔnfusion.

The plant's emergency response plans are being followed, and appropriate local, county, state and federal officials have been notified. The *[Nuclear_Power_Plant_Name]* is located *[Describe_location]*. People within approximately 20 km/kyd or 10 miles of the plant include *[Describe*	If you are within 20 km/kyd or 10-miles of the *[Nuclear_Power_Plant_Name]*, you should monitor your local Emergency Alert System stations. County and state officials will keep you informed if any protective actions become necessary through local broadcast E-A-S stations and news media. Preparation is advisable. The Site Area Emergency remains in effect until further notice. This message will be updated in 3-hours, or sooner if needed. Use the Business Continuity and Disaster Recovery plan. For more information, check *(www.Official_Web_Site.gov)*, or tune to local news media. Please do not call *(9_1_1)*, except to report a serious emergency. 10-miles of the *[Nuclear_Power_Plant_Name]*, you should monitor your local Emergency Alert System stations. County and state officials will keep you informed if any protective actions become necessary through local broadcast E-A-S stations and news media. Preparation is advisable. Evacuation is suggested. The INES4 Emergency remains in effect until further notice. This message will be updated in 3-hours, or sooner if needed. Use the Business Continuity and Disaster Recovery plan. For more information, check *(www.Official_Web_Site.gov)*, or tune to local news media. Please do not call *(9_1_1)*, except to report a serious emergency If you are within 20 km/kyd 10-miles of the *[Nuclear_Power_Plant_Name]*, you should monitor your local Emergency Alert System stations. County and state officials will keep you informed if any protective actions become necessary through local broadcast E-A-S stations and news media. Prepare NOW. Evacuation is advised. The INES5 Emergency remains in effect until further notice. This message will be updated in 3-hours, or sooner if needed. Use the Business Continuity and Disaster Recovery plan. For more information, check *(www.Official_Web_Site.gov)*, or tune to local news media. Please do not call *(9_1_1)*, except to report a serious emergency. 10-miles of the *[Nuclear_Power_Plant_Name]*, you should monitor your local Emergency Alert System stations. County and state officials will keep you informed if any protective actions become necessary through local broadcast E-A-S stations and news media. Evacuation is recommended. Take only essential items. Do not delay. Bring prescription medications and Identification. Lock your windows and doors as you leave. Bring pets in a carrier or on a leash. Please observe normal traffic laws and obey emergency officials directing traffic. Check the applicability of school children evacuation; if so, do not pick up children from schools in the evacuation zone. 10-miles of the *[Nuclear_Power_Plant_Name]*, you should monitor your local Emergency Alert System stations. County and state officials will keep you informed if any protective actions become necessary through local broadcast E-A-S stations and news media. For your safety, if you are in the evacuation zones, you must leave NOW! Take only essential items. Do not delay. Bring prescription medications and Identification. Lock your windows and doors as you leave. Bring pets in a carrier or on a leash. Please observe normal traffic laws and obey emergency officials directing traffic. Do not pick up children from schools in the evacuation zone.	*[Incident_Time]* Grave emergenza nucleare probabilmente a *[Nuclear_Power_Plant_Name]*. Aspettatevi di prepararvi ora. Some note

Reasons for Automation Priority Value;
1) With Satellite Digital Audio Radio (SDARS, e.g. SiriusXM) a nationwide distribution of alerts is being made. This means that a queueing system with
2) As detailed below, there needs to be a basis for a CAP or EAS+ message processor to be interoperable with the program playout automation system. This would best be related to the Event Terms.

3) The public would like to be able to have some control over the messages they are receiving. This is arranged like a volume control 1 to 9, with 0 being special cases like Schoo Closing which can be lengthy.The default setting at factory reset would be 5.
The Automation Priority Value 1 to 9 plus 0 equivalent to 10 is in a volume control order. I.e. the most important is 1, with 9 and 0 (=10) being least. This is important for interaction between an Encoder/Decoder and an Automation System used in all TV and most radio stations. "None" is not available. Consumer receivers MAY use this to provide users the ability of an "Alerting Level Control" with a default level of 5.
12) For best implementation, EAS+ encoder/decoders SHOULD be automation communicable devices via standard protocols such as VDCP. Automation Priority Value 1 SHALL be immediately transmitted, Priority 2 and 3 within 8 minutes, Priority 4 and 5 within 16 minutes, Priority 6 and 7 within 24 minutes and all others within 30 minutes. If the traffic does not permit this, then SDARS and DBS nationwide systems SHALL be permitted to operate as priority queue best effort. As the data transmission rate is faster in this mode, practical results SHALL be obtained before changes are made. This is inadequate for the cable/telco implementation. The most promising solution to this is to use is to use the Event Information Table (EIT) in the Program and System Information Protocol (PSIP). This is defined by ATSC. The message format is not currently defined, but MAY be single entry, or multiple flexible. Essentially, the originator would include in the PSIP stream opportunities for EAS signal insertion every 8 minutes maximum. If no PSIP is present or a timeout occurs, the encoder/decoder will insert the EAS message unless it is
10) Priorities 1 and 2 SHALL override EAS DND (Do Not Disturb) settings in consumer devices. Priorities of 2 and lower (i.e. number higher) SHALL override all higher messages, which SHALL be stored in a buffer and retransmitted when the priority queue permits. An incomplete message will Therefore, be accepted on re-reception.
11) Priority 0 consider as priority 10, messages SHALL NOT be transmitted to SDARS or DBS. Neither SHALL PDW nor PDE be transmitted. The volume of traffic is likely to become excessive. Making the urgency of priority 0 messages as
12) For best implementation, EAS+ encoder/decoders SHOULD be automation communicable devices via standard protocols such as VDCP. Priority 1 SHALL be immediately transmitted. Automation Priority Value 2 and 3 within 7 minutes, Automation Priority 4 and 5 within 14 minutes, Automation Priority Value 6 and 7 within 21 minutes and all others within 28 minutes. If the traffic does not permit this, then SDARS and DBS nationwide systems SHALL be permitted to operate as priority queue best effort. As the data transmission rate is faster in this mode, practical results SHALL be obtained before changes are made. This is inadequate for the cable/telco implementation. The most promising solution to this is to use is to use the Event Information Table (EIT) in the Program and System Information Protocol (PSIP).

Reasons for Automation Priority Value;

The Automation Priority Value 1 to 9 plus 0 equivalent to 10 is in a volume control order. I.e. the most important is 1, with 9 and 0 (=10) being least. This is important for interaction between an Encoder/Decoder and an Automation System used in all TV and most radio stations. "None" is not available. Consumer receivers MAY use this to provide users the ability of an "Alerting Level Control" with a default level of 5.
12) For best implementation, EAS+ encoder/decoders SHOULD be automation communicable devices via standard protocols such as VDCP. Automation Priority Value 1 SHALL be immediately transmitted, Priority 2 and 3 within 8 minutes, Priority 4 and 5 within 16 minutes, Priority 6 and 7 within 24 minutes and all others within 30 minutes. If the traffic does not permit this, then SDARS and DBS nationwide systems SHALL be permitted to operate as priority queue best effort. As the data transmission rate is faster in this mode, practical results SHALL be obtained before changes are made. This is inadequate for the cable/telco implementation. The most promising solution to this is to use is to use the Event Information Table (EIT) in the Program and System Information Protocol (PSIP). This is defined by ATSC. The message format is not currently defined, but MAY be single entry, or multiple flexible. Essentially, the originator would include in the PSIP stream opportunities for EAS signal insertion every 8 minutes maximum. If no PSIP is present or a timeout occurs, the encoder/decoder will insert the EAS message unless it is a priority 1, immediate. If there is more than one message of priority 2, both will be inserted at the next opportunity. If one is priority 2 and more are lower priority, then the lower priority ones SHALL await the next opportunity unless their timeout is Also, reached and an override SHALL be made. This data will connect through to the SCTE J-STD-042-2002 data, which is

Some notes

Reasons for Automation Priority Value;
1) With Satellite Digital Audio Radio (SDARS, e.g. SiriusXM) a nationwide distribution of alerts is being made. This means that a queueing system with prioritization would become needed during large disasters.

3) The public would like to be able to have some control over the messages they are receiving. This is arranged like a volume control 1 to 9, with 0 being special cases like Schoo Closing which can be lengthy.The default setting at factory reset would be 5.
The Automation Priority Value 1 to 9 plus 0 equivalent to 10 is in a volume control order. I.e. the most important is 1, with 9 and 0 (=10) being least. This is important for interaction between an Encoder/Decoder and an Automation System used in all TV and most radio stations. "None" is not available. Consumer receivers MAY use this to provide users the ability of an "Alerting Level Control" with a default level of 5.

		Spacecraft operations: May experience extensive surface charging, problems with orientation, uplink/downlink and tracking satellites.	(4 days per cycle)

		Other systems: Pipeline currents can reach hundreds of amps, HF (high frequency) radio propagation may be impossible in many areas for one to two days, satellite navigation may be degraded for days, low-frequency radio navigation can be out for hours, and aurora has been seen as low as Florida		

G 4	**Severe**	**Power systems:** Possible widespread voltage control problems and some protective systems will mistakenly trip out key assets from the grid **Spacecraft operations:** May experience surface charging and tracking problems, corrections may be needed for orientation problems.	Kp = 8, including a 9-	100 per cycle (60 days per cycle)

		Other systems: Induced pipeline currents affect preventive measures, HF radio propagation sporadic, satellite navigation degraded for hours, low-frequency radio navigation disrupted, and aurora has been seen as low as Alabama and northern California (typically 45° geomagnetic lat.).		

G 3	**Strong**	**Power systems:** Voltage corrections may be required, false alarms triggered on some protection devices **Spacecraft operations:** Surface charging may occur on satellite components, drag may increase on low-Earth-orbit satellites, and corrections may be needed for orientation problems.	Kp = 7	200 per cycle (130 days per cycle)

		Other systems: Intermittent satellite navigation and low-frequency radio navigation problems may occur, HF radio may be intermittent, and aurora has been seen as low as Illinois and Oregon (typically 50° geomagnetic lat.).		

G 2	**Moderate**	**Power systems:** High-latitude power systems may experience voltage alarms, long-duration storms may cause transformer damage. **Spacecraft operations:** Corrective actions to orientation may be required by ground control; possible changes in drag affect orbit predictions.	Kp = 6	600 per cycle (360 days per cycle)

		Other systems: HF radio propagation can fade at higher latitudes, and aurora has been seen as low as New York and Idaho (typically 55° geomagnetic lat.).		
G 1	**Minor**	**Power systems:** Weak power grid fluctuations can occur. **Spacecraft operations:** Minor impact on satellite operations possible.	Kp = 5	1700 per cycle (900 days per cycle

		Other systems: Migratory animals are affected at this and higher levels; aurora is commonly visible at high latitudes (northern Michigan and Maine).		
Scale	**Description**	**Effect**	**Physical measure**	**Average Frequency (1 cycle = 11 years)**

		HF Radio: Complete HF (high frequency) radio blackout on the entire sunlit side of the Earth lasting for a number of hours. This results in no HF radio contact with mariners and en route aviators	X20

R 5	**Extreme**	**HF Radio:** Complete HF (high frequency) radio blackout on the entire sunlit side of the Earth lasting for a number of hours. This results in no HF radio contact with mariners and en route	X20	Less than 1 per cycle

		Navigation: Low-frequency navigation signals used by maritime and general aviation systems experience outages on the sunlit side of the Earth for many hours, causing loss in positioning. Increased satellite navigation errors in positioning for several	(2×10^{-3})	

R 4	**Severe**	**HF Radio:** HF radio communication blackout on most of the sunlit side of Earth for one to two hours. HF radio contact lost **Navigation:** Outages of low-frequency navigation signals cause increased error in positioning for one to two hours. Minor disruptions of satellite navigation possible on the sunlit	X10 (10^{-3})	8 per cycle (8 days per cycle)

R 3	**Strong**	**HF Radio:** Wide area blackout of HF radio communication, loss of radio contact for about an hour on sunlit side of Earth **Navigation:** Low-frequency navigation signals degraded for about an hour.	X1 (10^{-4})	175 per cycle (140 days per cycle)
R 2	**Moderate**	**HF Radio:** Limited blackout of HF radio communication on sunlit side, loss of radio contact for tens of	M5	350 per cycle

		Navigation: Degradation of low-frequency navigation signals for tens of	(5×10^{-5})	(300 days per cycle)
R 1	**Minor**	**HF Radio:** Weak or minor degradation of HF radio communication on sunlit side, occasional loss of radio	M1	2000 per cycle
		Navigation: Low-frequency navigation signals degraded for brief	(10^{-5})	(950 days per cycle)

A	Remarks	
B	Sometimes "Statement" items are deleted. While these may not be as important to Emergency Managers, the item provides a lower priority if desired. Also it is helpful as a source of "Press Release" information for the news operations, which is of value to them.	
C	The priority number 1 to 9 plus 0 equivalent to 10 is in a volume control order. I.e. the most important is 1, with 9 and 0 (=10) being least. This is important for interaction between an Encoder/Decoder and an Automation System used in all TV and most radio stations. "None" is not available. Consumer receivers MAY use this to provide users the ability of an "Alerting Level Control" with a default level of 5.	
D	"Unknown" items are removed as these are relevant only to EAS receivers which do not have the latest software with the latest version of the Terms List.	
E	The words "hazard" and "threat" being now included, these shall be added to the translations, which are not included here.	
F	A "volunteer", Franklin Explorer is now available and shall be used to do an additional round of translation checking to make an iteration of improvement.	

G Native speakers of languages do differ in their translations, so some sort of averaging is appropriate. Translations of some languages simply use the phonetic equivalent in their alphabet of English (or other language) when an equivalent native word is also appropriate. There is variation by region also, e.g. French Canadian is legally prohibited from changing to current metro French. An international version is preferred here.

H The remaining National languages not translated are Bhutanese, Faroese, Guarani (Paraguay), Tok Pisin (Papua New Guinea) and the Native American Nations of the U.S. who have broadcasting in their language. Assistance in this would be appreciated, though not financially at present. Other languages in other nations (e.g. India) are currently considered the responsibility of those nations adopting CAP. Haitian Kreyol is to be added after the Franlin Explorer languages checking is completed.

I

"Public Health" items are moved to "health hazard"

J

Override or Digital Default refers to whether the code is provided the ability to override program content, or to be transmitted as separate audio and video with the selected/deselected receivers having the ability to opt out of the former or opt in for the latter.

K

A number of terms originate from older standards, mostly from TSOs (Tactical Situation Objects) and IEEE 1512. More information is in note 33 below (if notes included).

L non-weather issues. WMO acid rain and sulfur rain terms under this contamination item. Smog is a type of hazy. WMO Black Carbon is unclear as to whether this needs distinguishing from Ashfall or Toxic Plume. The WMO terms Annual Flood, Estuarine flood, Flooding, Fluvial (riverine) Flood, Ice and debris jammed flood, Single and Multiple Event Flood, Seasonal Flood, Snowmelt Flood are all rain or melting snow originated so are all Flood for Emergency Alerting Terms List purposes. Wet spell is a rain or flood question. Radio blackout is a Radio Transmitter item unless e.g. Geomagnetic Storm is affecting reception. Geomagnetic storm, Ionospheric storm, Solar energetic particles are all Space Weather. New Zealand Term Beach Tsunami is categorized as Tsunami with an arrival time of either one hour or less, or more than one hour. If calculated, the tsunami height and anticipated inundation map would be helpful information, and a basis for determining a Land Threat Tsunami. Aviation Tier 1 Lightning or Thunder are under Severe Weather or Thunderstorm.

South Asia has a number of languages that are shared. India has 21 official languages. Discussion centering on India would be relevant to deciding which languages other than English are used for alerting. While Devanagari is the basis of ISCII computer alphabet, it is not a nationwide alphabet. So no decision is made at this time as to the translation of terms.

The ISO format for displaying values is illustrated as "-7 654 321.987 6 km/h" where the spaces within the number are SHOULD be no-break En space(s) {HTML   NNBSP or &#81099} OR no-break Em space(s) {HTML   or &0160}, and the space between the last digit or decimal point SHOULD be a no-break Em space or two no-break En spaces. Such spaces are not string delimiters. A comma is not used as that is a string delimiter. A + sign may precede the value. The

	Factor	

0) WEA is assigned as follows: P for Presidential or EAN, C for Child abduction or CAE, others that are not assigned would apply to life threatening situations, but are not currently assigned. Currently there is no provision for checking if a WEA message applies to an EAS or AEA alert that has already been received and is

1) NWR denotes NOAA Weather Radio

2) NWS denotes National Weather Service

3) SAME denotes EAS compatible weather alert equipment.

4) Older EAS Decoders and SAME Weather Alert Receivers MAY NOT recognize EAS/SAME codes listed as "Effective June 30, 2004" unless they were manufactured or updated after mid-2002

5) The term City/County/Borough activation has been replaced by (reserved local code). This is to enable such local messages to be sent through local SMS, Emergency Telephone Notification or Reverse-911 systems locally used without using this state and national system. Sometimes such activations are somewhat

6) The descriptions Lahar and Cyclone are added.

7) This Table is fundamentally maintained by the FCC, and the W, I, A, E, S last letter format is used with the only exceptions already included above, or by addition

8) Any codes not listed SHALL be passed, and a default priority of 9 assigned.

9) Codes of lower priorities MAY Also, be allowed to override EAS-DND settings.

10) Priorities 1 and 2 SHALL override EAS-DND (Do Not Disturb) settings in consumer devices. Priorities of 2 and lower (i.e. number higher) SHALL override all

11) Priority 0 consider as priority 10, messages SHALL NOT be transmitted to SDARS or DBS. Neither SHALL PDW nor PDE be transmitted. The volume of traffic is likely to become excessive. Making the urgency of priority 0 messages as immediate shall not modify the use in DBS or SDARS message selection or a consumer receiver user selectivity feature.

12) For best implementation, EAS+ encoder/decoders SHOULD be automation communicable devices via standard protocols such as VDCP. Priority 1 SHALL be immediately transmitted, priority 2 and 3 within 7 minutes, priority 4 and 5 within 14 minutes, priority 6 and 7 within 21 minutes and all others within 28 minutes. If the traffic does not permit this, then SDARS and DBS nationwide systems SHALL

13) EAS tests can be used to cover engineering changes that would impact air in the chain before the EAS insertion equipment. This is a problem for the cable and receiver selected message configuration, but amendments to accommodate this possibility can be considered.

14) The RWW code is the same message as the RWT, but is OPTIONAL and it MAY be used to send something to the audience when the air chain is being rewired or equipment swapped, etc. This could be transmitted to headends or DBS by another event code in PSIP.

15) The FAS and FAW First Responders codes are for a redundant notification method if the primary method is unavailable. The IHS MAY be similarly used, or as messages directed to highway motorists.

16) Encoder/decoders that do not have an active automation interface SHALL operate in the immediate override mode. The times above do not apply. This is likely to be upgraded EAS Encoder/decoders, which are analog, and are analog radio or TV at the periphery of the daisy chain.

17) EAS+ compatible receivers or EAS+ compliant receivers via a configuration selection (default being on) SHOULD play the audio of the priority one code names before the audio. By default, this SHALL be in English, and other languages MAY follow by manufacturer choice. As Tornado, Tsunami and Lahar are multilingual words, the other English words MAY become accepted likewise.

18) ROS, Return OK Statement is applicable after AVW, EVI, ERW, FFW, NUW, NUn, RHW, SBW, TOR, and TSW. The duration in CAP is not used to trigger this message.

19) Rescue Required Emergency and Rescue Required Statement are to be sent to First Responders category only on HD radio and digital TV. Not for transmission on SDARS and DBS. Also, note that a polygon MAY be specified with one point only. This can be a position from an EPIRB or E911 Phase 2 position indication. As

20) LEW, Law Enforcement Warning, MAY be a message directed to homeowners only for example, and this is not a category that in the near future is expected to be practicable for people to configure in their consumer electronics. In such circumstances, where the priority is not So, high or it is used to aid apprehension of criminals, the distribution via other technologies such as ETN (formerly Reverse-911) where a database MAY be available that can be used in selecting appropriate phone numbers is RECOMMENDED. Alternatively, Law Enforcement Watch, LEA, MAY be used on private mode to the public or other selected category. LEE is

21) Codes PDF, DXF, SHP and any others that require applications to process them SHOULD use older versions of applications to generate the file So, recipients do not fail to receive the information because of the lack of the most current version being installed.

22) SDW, Shutdown & possibly evacuate SHALL always to be transmitted in private mode. Although it is priority 2, it would not normally be delayed as it is transmitted in private mode.

23) DMO is for making demonstration alerts or for system testing. They SHALL NOT be broadcast. The text SHALL clearly state that this is a demonstration, not an alert.

24) Authorization levels, from lowest to highest are A All, M Master Control Operator, E Engineering (8-character station/system designation), L Local Government, R Regional or Tribal Government, M Military or National Government. N National or Federal Government. S State Government. The

25) ADV, ADX messages SHALL NOT use magenta, red, yellow, blue, violet or orange as the background, green background may be used. Graphics resembling the rest of the video may be used.

26) SWE messages SHOULD be during program time only, not breaks, with program on the alternate PID or equivalent UDP or TCP Port.

27) Analog only radio stations MAY omit priority 0 and 9 messages. Such stations could be satellite or otherwise fed from a remote national uplink. Also, such stations SHALL state “EAS plus emergency alerting is not on this station.” Every two hours.

28) Analog only TV stations MAY omit priority 0 and 9 messages. Such stations could be translators for digital stations. The digital station SHALL transmit alerts which include the translator area, However, the analog translator SHALL only transmit alerts that pertain to the translator coverage area. Analog retransmitting

29) SLW and SLS MAY be beach patrols underwritten by businesses, who wish to gain advertising. As they are providing a community service at some expense, the coverage area and other forms of selectivity SHOULD NOT be particularly restrictive. This is a matter for some wisdom in application by the local jurisdictions, e.g. only to broadcasters with coverage of the area(s) of interest. Example applications are sharks and riptides.

30) The event codes that MAY use unknown duration and exceed 2 minutes SHALL only be EAN, STA and SWE. Such activations SHALL be with the awareness that legacy ENCODER/DECODERs will truncate the message audio after two minutes. The SWE (school weather emergency) message is typically longer than two minutes. In EAS and EAS+ they would be scheduled to replace programming rather than advertising; However, analog only radio stations would not have the capability of permitting the listener to be continuing listening to

31) LAS, Local Area Statement is an event code that SHALL NOT be carried on EAS. It is included here as sometimes local authorities issue statements via emergency alerting technologies such as ETN which do not meet the stricter criteria required to issue an EAS alert.

32) TSA, Tsunami Watch is intended for tsunamis with a distant origin that are not expected to arrive within an hour at the earliest location of message delivery. In IEEE1512, this is assigned to the tidal wave emergency. With the urgency set at Immediate, the airing of the alert is as soon as possible without it being an immediate override. An expected arrival time of over one hour, if evacuation is

33) The codes Aircraft, large Balloon Advisory (ABS); Aircraft, large Balloon Warning (e.g. crashing) (ABW); Dangerous Animal(s) Advisory (DAS); Dangerous Animal(s) Warning (DAW); Fire Condition Advisory (e.g. dry vegetation) (FRS); Fog Advisory (FOS); Hail Advisory (HAS); Hail Warning (HAW); Hazy (visibility limited for driving) (HZW); Ice Advisory (ICS); Icy Conditions Warning (ICW); Oil Tanker Leak Statement (OLS); Oil Tanker Leak Warning (OLW); Power Lines Warning (PWW); RF high field strength Warning (at high power transmitters) (RFW) (Broadcast Engineers handle this and Emergency Alerting Systems So, SHALL be given access

34) IEEE 1512 provision added. AMBER Alert is already included there. The <vehicle> item is adapted to the terms used there. The section below is from the Disasters list in IT IS-00-00-00. The 30?? Ids are used in the IEEE 1512 standard. This is after the TSO, additions. The / added below indicates such additions. While developing an application to translate between the two systems, or adding CAP ability to an IEEE 1512 based Computer Aided Dispatch (CAD) is adding complexity, the first step is to rationalize the terminology. While standards developers are likely not intending to develop “silos of complexity” that do no interoperate, there may need to be some acceptance of extensions of scope to enable reasonable interoperability by project sponsors.

```

35) The CAP profile for Canada has a set of emergency terms. These may be incorporated by equivalence or addition and noted in this item as is following. As this is a different jurisdiction the use of such additions is dependent on the CAP message and not currently for use in U.S. originated messages. This avoids the necessity for a different profile for each country, which is a problem when cross-border messages for cross-border disasters occur. The CAP Canadian Profile table has eveCode for their CAP EVENT CODES. The EAS+ message SHALL include

<eveCode>

<eveCode=*eveCode*>

</eveCode>

36) The EQE code is designed for automated earthquake alerts. This message may be transmitted without validation, e.g. only one seismometer with a threshold

37) SAME codes 000-999 are reserved for message codes if adopted or used as follows. Also <*letter EXCEPT E, M and V*>00-99 are reserved for file and update codes. There shall be an encrypted code to description and file extension table and only the description shall be displayed for the user to approve the file or update installation. If there is no code with an entry, there shall be a message saying that the file or update is unrecognized or erroneous and that there is an error with an ID of <*character*><*Code*> where the character is a format character beginning with the use of "1". If the <*letter*> is w, x, y, z, W, X, Y, or Z, then these are reserved letters and the error message shall not display. If the <*letter*> is U, V, W, X, Y or Z, the message SHALL only be transmitted on digital TV, this is to avoid transmission of large files over HD Radio.

38) While CAP is a computer protocol, EAS+ is applicable to consumer radios and TVs and related devices. As the economics of consumer electronics are toward having one design that can be used worldwide, to increase production volumes and lower costs, the implication of this is that once the specification is developed into a standard, the standard needs to be applicable worldwide. So, EAS+ has to be applicable to every CAP and EDXL-DE profile. The software in the consumer electronics effectively cannot be considered to be upgradeable. Even dealing with the variety of languages by using Unicode is a significant additional memory cost, and the trend towards the English alphabet, or at least the International Phonetic Alphabet, is influenced by economics.

39) For EQE and EQW event codes, in order to provide for legacy HD Radio receivers and analog receivers, the best method appears to be to send the EQE and EQW alerts immediately on the analog audio and force tune all legacy HD Radio receivers to the analog channel. This does not add to the bandwidth required and has the lowest latency. The same method may Also, be applied to all other alerts. EAS+ compatible HD Radio receivers would then, if not selected for an alert, would then have the HD Radio program continuing as normal. The disadvantage of this method is that there would not be any private mode possible on HD Radio unless a smaller bit depth and lower sample rate mono channel data could be included. This may be practical with FM. If the State Plan provides for two independent TV channels to be LP1 and LP2, and the digital daisy mesh core network is TV based, then that is not necessarily a problem. Regional or local LP3 or LP4 stations could be included in

40) The False Alarm Emergency (FAE) code is for example so that seismologists can monitor, and so that automated alarm system from seismometers to the public be implemented. Then it would be possible to send correcting information when the EQE code is generated which is only broadcast digitally. The FAW (False Alarm Warning) code is similarly applied when the EQW code is a false alarm. FAS (False Alarm Statement) is for when a priority 1 message is not justifiable. Having this option would enable the earthquake warnings to be faster by not requiring human approval, and enable human oversight to be effective. The actual use of this approach would depend on circumstances, experience, public acceptability, and how this is incorporated in the State Plan. The implementation in a user interface may select which of FAE, FAS or FAW depending on the event code of the message being corrected instead of adding complexity for the user. This is becoming an extremely complex system, and with staff turnover and the low frequency of disasters, it is desirable to avoid complexity.

41) MSW, Missile incoming Warning is a radar generated warning and is only likely to be used in situations where combat is anticipated. It would be processed similarly to EQE for rapid alerting. If the consumer electronics receiver does not provide for MSW, it SHALL be certified as compatible only as EAS-nm if other certifications are met.

42) Nuclear Power Plant Statement NUS added for an all clear or information of lower priority. NU*n* INES International Nuclear Event Scale; 0 Deviation, (Incidents) 1 Anomaly, 2 Incident, 3 Serious Incident, (Accidents) 4 Accident with local consequences, 5 Accident with wider consequences, 6 Serious accident, 7 Major accident.

43) Advertisement to selected area or receivers ADX. Video from separate encoding overrides the program video, or MPEG-4 other data e.g. X3D or UML transmitted on video PID or equivalent UDP or TCP Port +*n* (if available). The value of *n* is 1,2,3,4,5 or 6. If *n* is greater than 1, this is when multiple ADV or ADX messages are active simultaneously. The *n* value is the order of the message. All ADV or ADX messages SHALL terminate with one end-of-message. Video

<videoPID or equivalent UDP or TCP Port>

<videoPID or equivalent UDP or TCP Port=

</videoPID or equivalent UDP or TCP Port>

in the EDXL or CAP realm, or in the automation control to the EAS encoder/decoder. In the EAS+ format this becomes <videoPID or equivalent UDP or TCP Port=*nnn* >, and the language1 becomes Audio 1 and 2 on PID 0x1FFE or equivalent UDP or TCP Port and the language2 becomes Audio 3 and 4 on PID 0x1FFD or equivalent UDP or TCP Port, with PCR values matching the selected video PID or equivalent UDP or TCP Port. For surround sound, Dolby Digital may be used. Language3 may be audio 5 and 6 on PID 0x1FFB or equivalent UDP or TCP Port if used. Then the audio needs delayed playout for lipsync. Only one such insertion at a time per encoder/decoder is possible, So, traffic input to the automation system would be required to be keeping not only overlaps avoided, but Also, insert buffer times as playout times can vary, e.g. games run into overtime. ADV operates in a similar manner, but the advertisement audio and video are inserted in the program stream, with the secondary stream containing normal program content. So, the selection criteria is reversed within the broadcast coverage area. This is different from MPEG splicing. It adds to the receiver decoder cost, So, there needs to be an incentive for this to be acceptable. There are two incentives for this, EAS+ and advertising. The initial implementation may not incorporate this capability. . For HD Radio, ADV is program/default advertising on the analog signal and the alternate on HD1. ADX is for the program/default advertising on HD2 (if available) with the alternate on HD3 (if not assigned to program), or in the case of Weather Radio on HD3, then the alternate advertising may be placed there if agreed to. In addition, the HD3 Weather Radio program is subject to being switched to the analog signal IF an alert is transmitted AND the force tune to analog code is transmitted AND the selection criteria is applicable. If the selection is for First Responders (e.g. for exercise), the force tune code SHALL be applicable to cosumer receivers but NOT for First Responders receivers

The ADV and ADX priority settings in consumer receivers are ignored So, as to be not user adjustable. Also, two or three EAS+ messages may be active simultaneously to provide for multiple selection criteria with different languages. The first header T^1 SHALL apply to audio 1 and 2, the second T^2 to audio 3 and 4, the third T^3 to audio 5 and 6. The first received end of message SHALL terminate all ADV and ADX, even if it is for a subsequently overriding other alert messages. See subsequent suggestion for usage with immersive sound as proposed for ATSC 3.0.

44) The CAE code may be ignored in an alarm clock radio, TV or cellphone when it is less than nine hours before the alarm set time. When alarm clock radios that have HD Radio or equivalent and are in standby, the station tuned to SHOULD be one that digitally transmits alerts if the user selected one is not. Reverting to the user selected station on alarm SHALL Also, be done. An indication of "0 EAS+" SHOULD be made to the user for such stations or if no stations are available prior to entering standby.

45) The EQE event code may be transmitted to a small polygon centered on the location N33.0001^{o}, E120.0001^{o}, which is off the coast of Los Angeles. Coverage selection criteria for messages shall include this location. This location shall be the default location of consumer electronics products, thereby such a message would inform the owners that they need to enter the actual location of the product for effective use. Also, system test messages may be transmitted to this location and So, checked easily.

46) About 5 minutes after an EQW is issued, an RWT should be issued from the same input to EAS, to the same area, as digital only. This is to initiate a QC process So, that the condition of the network is assessed after the earthquake and any steps appropriate may be initiated to ensure the network is available for the distribution of alerts which may be needed for secondary shocks or problems. This may be optionally triggered automatically by software, the default value being that it is turned on. The purpose of this being automatic is because it is anticipated that Emergency Managers are expected to be otherwise occupied at such times.

47) EQ0 is the finish of an earthquake alert sequence. EQ1 to EQ9 are the sequence of alerts and may be defined further by an octagonal shape or polygon. EQ0 to EQ9 SHALL NOT to be presented by alarm clock HD Radios when in the standby mode unless a user setting permits that. The default is not to present. Cellphones that are charging and 9 or less hours prior to an alarm set time SHALL NOT present EQ0 to EQ7 alerts unless a user setting permits that. The default is not to present. IF the user is able to change the duration, nine hours SHALL be the default value. While the sequence is numerical, values may be skipped and results that depended on reaching a particular value SHALL be triggered by the first value larger arriving if the selected value is skipped or the EQW code. While it may be considered to be of

48) VG1 to VG4 are for overlay graphics or video in a language that is not in the original video. Priority 1 is to get this started in sync with the program start. It is selected if such video is available for playout. Otherwise the content is digital black for zero data. The timeout for this is 3 hours which applies in case no end of message is sent. If an EAS message is to be transmitted, this mode SHALL send an end of message immediately, and SHOULD resume IF the content is still in the playlist. In combination with secondary audio for other languages already a developed technology, this improves dual language TV broadcasting. The digit value corresponds to the language definition in the header. The value of the original video language SHALL be contained in; <videoOriginalLanguage=*n*=*xxx* > where *n* is the header language number and *xxx* is the ISO, language 3 letter code. This message SHOULD be re-transmitted after 5-minute intervals or a station break end, whichever comes sooner, until the end of message. One overlay graphics MAY be available at a time, though multiple language audio is. This depends on the video compressor having an added input above the extra one for one overlay. This may change with added overlay video on successive PIDs or equivalent UDP or TCP

49) NFA, News Flash on TV SHALL be presented with a green background and MAY have a beep at the audio beginning EXCEPT that if the information is relating to an emergency the code NFE SHALL be used, THEN the background SHALL be orange and the audio on analog TV SHALL have the header in modem tones for QC logging. If it is legacy digital TV the SAP assigned PID or port SHALL carry the audio. If it is a new standard TV, the emergency audio PID or port SHALL carry the emergency audio and the SAP assigned PID or port SHALL carry the emergency audio in the SAP language If it is available. It would be dependent on the receiver captioning decoder circuitry if the broadcaster does not provide a separate character generator into the secondary video to the compression system. This is applicable to the 21st Century Video Accessibility Act (CVAA). The station puts the audio on emergency audio channels as languages are defined. On analog TV the SAP channel is used. On digital TV the remote MAY access this audio via an SAP button or other means that the public readily understands. The default for digital TV is that NFA audio SHALL be available when SAP or equivalent is selected and the on and off SHALL be available. For NFE audio on digital TV, the default SHALL be that it SHALL override program audio and that SAP or equivalent selection SHALL be the

50) Traffic advisory and traffic emergency (TFA and TRE) codes are provided for use in areas where the population density is low. Data transmission to navigation devices (e.g. Tomtom) may not be available, and EAS being in competition with private enterprise solutions is not proposed. Also, radio stations often provide verbal traffic reports. So, use of such messages, which are likely to be numerous, should be coordinated with other providers of such information. When the cause of the traffic disruption is under the responsibility of Emergency Management (e.g. terrorist activity) instead of the normal Police and Fire coordination, then use of such codes may be made in the interest of urgent mass alerting. These codes are digital, So, promoting the adoption of improved HD Radio navigation receivers is desirable. In countries where DAB, DAB+ or DMB are used, the notes concerning HD Radio SHOULD Also, apply to these systems. EAS data SHOULD have priority over such traffic congestion data.

51) Codes which SHALL NOT be implemented in consumer receivers are ONLY ABA, ASA, DMO, FRV (unless First Responder model), FIW (unless First Responder model), IE1, I1E, HIS, LAS, NMN, PCR (unless First Responder model), RFW, ROS (unless First Responder model), TSO, (unless First Responder model), TEO (unless First Responder model), TXB, TXF, TXO, TXP, ??A, ??E, ??S, ??W

52) Yellow YLW and Blue BLU Alerts are transmitted with the same number plate distribution as for AMBER or CAE Alerts. Yellow Alerts are for purposes such as hit and run suspects, murder and violent armed robbery suspects, gang wars and similar situations as determined by State, Tribal, Regional or Federal legislation. Blue Alerts are for when a suspect has injured or killed a law enforcement officer. Partial number plates with three or more beginning or end characters may be used IF

53) "All Clear" statements SHALL use a light green background. These are for event codes FFS, HUS, HLS, CIS, DAS, EQ0, FAS, FRS, NUS, OLS, ROS, RRS, SLS, UTA.

54) RHT is a Required 6 min Test, which transmits the actual local time when transmitted as scheduled by the automation. This is a "heartbeat" message originating at the broadcaster EAS+ equipment. This enables the clock correction of receivers and Also, the selection of a different station when the EAS equipment is

<lipSync>

<*L* (A-V)=(+/-)*nn* (F/f)>

</lipSync>

Where *L* is the language number (1 for primary, 2 for SAP, etc.). *nn* is 0-99 (no leading 0), F is frames, f is fields for interlace. The value is data obtained from the air monitor receiver (QCMR) output video. Consumer TVs SHALL offset the PCR

A method to monitor lipsync is for the video switcher to have a GPO that outputs a pulse whenever a scene change is made. The pulse gates a burst of 18 kHz audio mixed on to the Left audio signal. At the receiver output the Left audio is filtered by an 18 kHz narrowpass filter and the waveform monitored and compared with the video waveform changes. The timing difference (less the measured offset at source) is the lipsync error.

The message MAY include the string as below;

Callsign N/SLat E/WLong, HH:MM, Callsign N/SLat E/WLong Frequency, (Callsign N/SLat E/WLong Frequency MAY be repeated IF the listed callsigns have a similar heartbeat signal). If there is no decimal point, the last digit of latitude or longitude SHALL be taken as the 0.1 degree digit. This string is to enable a receiver to automatically tune to a similar station as the signal from the current one fades and another becomes received as the driver moves from one reception area to another. HD Radio callsign for FM is normally the HD1 to select, but HD2 or HD3 callsigns MAY be used.

55) FLH, FLX, HUH, HUX are expected to be available from NOAA in 2015, though public distribution is not yet announced. TSH and TSX are maps that are difficult to calculate and the time frame is much shorter. These two codes are placeholders pending such capability. Also, as the limitation of data may mean that simplification is required, and that AM HD Radio is inadequate for this purpose. Also, many newer vehicles have stubby antennas which are usually poor at receiving AM broadcasts. VHF Weather Radio may use IBOC as a data transmission capability. The data rate may be higher than for FM HD Radio. (NOAA has made no comment regarding such a development, and may not do So, before a broadcast implementation has resulted in the availability of receivers that can take advantage

56) If a Watch or Advisory for an event code (--A) is awaiting transmission and a Warning event code (--W) is received for the same region (PSSCCCXXX), then the Watch SHALL be deleted.

57) Except for priority 1 and required alerts (R-1), any alert MAY be selected to be transmitted in the digital only mode by the broadcaster. The default value SHALL be non-digital where this is specified in the event code table. Also, any digital only mode alerts MAY be selected to be transmitted in the analog mode This SHOULD

58) E*nn,* M*nn* are countdown triggers in the receiver. The value 00 is a timer reset. The values 01-09 are seconds of countdown start value. The value 10 SHALL NOT be used. Values 11-99 SHALL have the tens reduced by 1 and the resulting value multiplied by 10. This gives a maximum of 980 seconds. The timer SHALL reset at 985 seconds or receipt of an E00 or EQ0 message. Receipt of an E*nn* or M*nn* message for the selected receiver SHALL start the timer and output the countdown, beginning with the word “EARTHQUAKE” or “MISSILE” at the start and every 10 seconds UNLESS the timer is already running for a previously received E*nn* or M*nn* message. Polygon area selection SHOULD be as an octagonal shape. I will be possible to have a series of alerts for a central octagon followed by wider octagonal

An S-wave propagates at from 2 to 8 km/s. So, in 980 seconds, an S-wave would travel from 1960 to 7780 km. An R-wave propagates at from 50 to 300 m/s. So, in 980 seconds it would travel from 49 to 294 km. Assuming the alerting is based on S-wave arrival at the slowest velocity, an alert of this type would be limited to 1960 km maximum range. This is greater than the diagonal distance of California NW to SE (1375 km). It Also, is possible to cross state borders, So, adjacent states may need to be alerted. If areas outside of the maximum range are to be alerted, subsequent alerts using polygons or FIPS codes or State Sectors may be appropriate. State Sectors are using the P sector method applied to the whole State code. These would need to be defined by the SEMO and SECC. As the waves propagate, subsequent seismometer detections can provide data to more correctly measure the velocity of propagation and the magnitude. That data could be applied to modify the subsequent alert transmissions. Extending a laboratory test system to process such

59) The code SFW may be triggered by a stellar flare, solar coronal mass ejection causing a Carrington event, or an electromagnetic pulse (EMP). However, as EMP travels at the speed of light in space or air, a precursor event could be used as a trigger. This could be the launch of an ICBM or a reversal of the earth's magnetic field for example. Such an alert is of value in adopting hardening measures such as switching to locally generated power.

60) The code PGM is for normal TV program content. For digital TV this MAY be used for some metadata. The priority 10 means that it has a priority of 1, but it SHALL ONLY be distributed accompanying the program content as is priority 0. A) It is to provide a map of the language assigned to either AES audio channel(s) if stereo in the manner described for ADV or ADX. B) It is to provide audio object group assignment for the corresponding alerting language selection to the language in the manner described for immersive audio in Section III. C) It MAY contain a lipsync offset XML section as described in note 54 for RHT. If used, this message

000 No language assignment in EAS+, use other method if defined

001 EAS+ language assignment SHALL be applied

010 Other language assignment SHALL be applied if defined

011 Other language assignment SHALL be applied IF defined AND data present, Otherwise EAS+ language assignment SHALL be applied.

100 to 111 reserved

The timing of the EAS+ message and processing time SHALL be tested So, as to synchronize the audio progressing with the start of program content.

language assignment for viewer selection SHOULD be coordinated with the audio selection, and Also, with the source file or feed language metadata. The standards definition of this is

The emergency message use of captioning makes it desirable to be able to scroll the message back down So, as to be able to review it, which EIA-708 presently does not do. The likely interface for this is to use the up and down cursor buttons on a remote. Scrolling up SHOULD result in no captioning displayed for blank line(s). This is an ODIC request. Also, note that in the ASCIIchart document are some other captioning extensions, particularly for displaying music and songs for optional singing along.

61) The code EDQ is for encrypted EDXL-DE files, and only to be transmitted with agreement with the broadcaster. Higher bit rates may be supported in such an agreement.

62) The code VO*n* is to be usage determined by nation. New Zealand is currently using this designation. VO0 should be a reset, and if VOO is entered, it shall be converted to VO0.

63) The transmitter control codes (except TXQ) are used by NOAA Weather Radio, and MAY be used in an EAS system IF there is a Memorandum Of Understanding between specific Emergency Management Offices and specific broadcast companies regarding specific transmitters. All messages SHALL result in a Transmitter Status

64) Enhanced Fujita Scale (EF Scale) of Alabama Tornadoes on April 27 as an example.

EF Scale	Estimated Top Wind Speed	
EF-0	65-85 mph	
EF-1	86-110 mph	
EF-2	111-135 mph	

EF-3	136-165 mph	
EF-4	166-200 mph	
EF-5	More than 200 mph	
Source: TRAC citing NWS, p. 14		

65) Binary is not permitted. It may include ASCII control codes. Intel Hex format by default is not permitted, and if received, SHALL be ignored Unless the permission is manually, with user password, enabled at the encoder and the decoder/receiver. When the message is received, the permission SHALL revert to disabled. A filename SHALL be specified.

66) Q*xx* and *nnn* codes added. Q codes are defined by the ICAO for aviation, MMS, the Maritime Mobile Service and ITU-R. ARRL use a variation for the QN*x* range. *nnn* may be 10- or other, with the last 3 digits used, except that a leading zero is added if there is only one digit after the -.

67) The European Meteoalarm (www.meteoalarm.org) schema does not distinguish between severity and certainty. An explanation is under that topic, and under the Severity and Certainty code assignment. When there is no alert for an area, this can be transmitted after an alert message, and otherwise at an interval to be determined by the usage technology. EventCode NON is used with severity code 111.

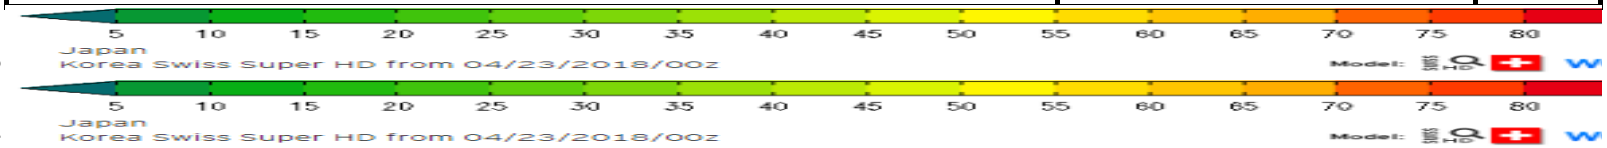
68) Digital only in HD Radio means that the force tune to analog is activated, HD1 stream carries the alert, not analog. Receivers that are selected for the alert switch to HD1. This means that legacy HD Receivers that have selected HD2 or HD3 will receive the analog signal rather than their selected stream. This is expected to be an inconvenience that is infrequent. This is a detail that can be used to promote sales of new receivers with this improved alerting feature. OR the force tune is not activated and the highest FM HD channel is used for NOAA Weather Radio and the audio

69) The alerting for WFW Wildfires and FOW Fire Forest Warning, are an alerting problem because the region may be remote and have few roads. So, an alert that is for many people that are not affected, it would result in evacuee road traffic that would be a serious impediment for firefighting and other emergency vehicles. When Emergency Managers have no precise understanding of WEA coverage anticipated, and the current EAS having no location selectivity, neither method may be used, which has resulted in fatalities because of the limitations of other means. The use of Digital Only for Television and DAB, DAB+, DMB and DRM is recommended when these concerns are applicable. Therefor the policy needs determination on a regional basis for the alerting application, and appropriate additional software.

70) The outdoors fire condition MAY correspond to signs that have an indication as follows;

EEE EVENT CODE	eveCode	
FCS (FW0 to FX3)	fireCondOK	
FRS (FW4 to FX5)	fireAdvisory	

FMA (FW6 to FX6)	fireWeather	
FHA (FW7 to FX7)	fireBan	
FRA (FW8 to FX8)	fireDangLvl	
FXA (FW9 to FX9)	TotalFireBan	
FW*n* (see above)	KJS below where *n* is tens	
FX*n* (see above)	KJS below where n is tens add 5.	
Below is Korea-Japan Switzerland		



71) SQW is recently added by NOAA Weather Radio. Previous versions of this had WSQ as the code.

72) Travel and Lockdown levels

travel level 1 - Exercise Normal Precautions

U.S. State Department Travel Levels
This is the lowest advisory level for safety and security risk.

travel level 2 – Exercise Increased Caution

travel level 3 – Reconsider Travel

Be aware of heightened risks to safety and security. The U.S. Department of State provides additional advice for travelers in these areas in the Travel Advisory.

travel level 4 – Do Not Travel

Avoid travel due to serious risks to safety and security. The U.S. Department of State provides additional advice for travelers in these areas in the Travel Advisory.

travel level 5 – Travel Not Permitted

This is the highest advisory level This may be an action taken by a particular country, or appropriate authority in the U.S. and is not a U.S. State Department decision. For example Pandemic Lockdown/Curfew or ATC0 (Air Traffic Control 0 with no flights).

This is the highest U.S. State Department advisory level due to greater likelihood of life-threatening risks. During an emergency, the U.S. government may have very limited ability to provide assistance. The U.S. Department of State advises that U.S. citizens not travel to the country or leave as soon as it is safe to do so. The U.S. Department of State provides additional advice for travelers in these areas in the Travel Advisory.

73) The characters I (uppercase i), l (lowercase L) and l (number 1) may be confused. This is more of a problem when the language or context c

74) The Seismometer Code for the first seismometer indicating an EQW event, which may be part of a sequence of alerts is indicated as e.g. <seismoCode=EEW*nnnn* > or e.g. <seismoCode=SWS*nnnn* >, This is to enable multiple seismometer networks to contribute to overall warning distribution on multiple networks, and to thus easliy recognize alerts they contributes and avoid messages as echos.

75) End of use notes

New Zealand Levels, one value less equivalent.

Alert level one: Prepare

This level applies when COVID-19 is present in New Zealand but contained. Before Saturday, New Zealand was at this phase due to the risk of importing the illness and sporadic cases popping up. There was also a few cases of transmission within households. In response, some border measures were introduced, contact tracing began, self-isolation for the infected and their close contacts was required, and limits were put on mass gatherings. The public was also encouraged to consider how they were limiting their exposure through physical distancing and to stay home if they began to feel unwell. Key messages began to be frequently communicated, including to wash hands, cough into elbows and don't

Alert level two: Reduce - New Zealand's current level

New Zealand moved to this level of Saturday after authorities deemed the likelihood of new cases being recorded as high. There has been an increase in imported cases and cases transmitted within households. This suggests that COVID-19 is contained, but the risk of community transmission is growing. Currently, there is no confirmation of community transmission in New Zealand, however, two cases don't have clear links to overseas travel and investigations remain underway. Under this level, border measures have been increased and more restrictions have been put on mass gatherings. Authorities are now calling for greater physical distancing on public transport, limiting non-essential travel around the country, employers start implementing new ways of working, such as remote working, businesses activate their continuity plans, and vulnerable people, including those over 70, stay at home.

Alert level three: Restrict

This is the next level that could apply to New Zealanders. It would come into effect if authorities believed that there was a heightened risk that the illness is no longer contained. This could mean that community transmission is evident or that multiple clusters of COVID-19 break out. Those regions or centres with clear clusters or community transmission could have their travel limited, public venues and affected educational institutes would be closed, mass gatherings would be banned, and alternative ways of working would be required with some non-essential businesses closed. Changes would also be introduced within the health system. For example, primary care consultations would no longer be face-to-face, while elective services and procedures would be deferred to allow for healthcare staff to be freed up.

Alert level four: Eliminate

This is the top-level and would be activated if it is "likely" COVID-19 is not contained nationally or at a local level. There would have to be intensive and sustained transmission with widespread outbreaks. Under this level, people would need to stay at home, all educational facilities and non-essential businesses closed, supplies would be rationed, facilities would be requisitioned, travel would be severely limited and all healthcare services would be reprioritised.

do not indicate which character is to be used. This is also important in an emergency

Expressed in terms of SI base units

$m.m^{-1}$

$m^2 \cdot m^{-2}$

s^{-1}

$kg \cdot m^{-1} \cdot s^{-2}$

$kg \cdot m^{2} \cdot s^{-2}$

$kg \cdot m^{2} \cdot s^{-3}$

$s \cdot A$

$kg \cdot m^{2} \cdot s^{-3} \cdot A^{-1}$

$kg^{-1} \cdot m^{-2} \cdot s^{4} \cdot A^{2}$
$kg \cdot m^{2} \cdot s^{-3} \cdot A^{-2}$
$kg^{-1} \cdot m^{-2} \cdot s^{3} \cdot A^{2}$

$kg \cdot m^{2} \cdot s^{-2} \cdot A^{-1}$

$kg \cdot s^{-2} \cdot A^{-1}$

$kg \cdot m^{2} \cdot s^{-2} \cdot A^{-2}$

K

cd

$m^{-2} \cdot cd$

s^{-1}
$s^{-1} \cdot mol$

Number of circuit hours used per hour (telephony) OR the character between the value and the exponent or powers of 10 in scientific value notation. If the latter, there SHALL NOT be any spaces alongside.

OR a way of printing a decimal point that is more robust against being obscured or removed on items. The latter is of value if the digits are in triplets as ISO recommnended number format.

An alternative to the – electrical charge symbol. The color SHOULD be black.

An alternative to the + electrical charger or hole conduction symbol. The color of the whole symbol or of the + portion of it

69) The alerting for WFW Wildfires and FOW Fire Forest Warning, are an alerting problem because the region may be remote and have few roads. So, an alert that is for many people that are not affected, it would result in evacuee road traffic that would be a serious impediment for firefighting and other emergency vehicles. When Emergency Managers have no precise understanding of WEA coverage anticipated, and the current EAS having no location selectivity, neither method may be used, which has resulted in fatalities because of the limitations of other means. The use of Digital Only for Television and DAB, DAB+, DMB and DRM is recommended when these concerns are applicable. Therefor the policy needs determination on a regional basis for the alerting application, and appropriate additional software.

70) The outdoors fire condition MAY correspond to signs that have an indication as follows;

EEE EVENT CODE	eveCode	Color	ASEAN	New Zealand	Canada	USA HDW WFAS	Beaufort/ HU*n* to right	The table b 3 to 4

Label	Meaning
{ }	Computer inserted default value
( )	comment
[ ]	User inserted data
[10-digit including area code telephone number without spaces]	size may vary by region
{9_1_1}	Country selected default value (911 for North America)
{a beach/location}	name
[Age]	Estimated age of person described
[Agency]	Government agency or authorized representative
[Alternative_Emergency_Number]	The emergency alternative number if the regular number is inoperative
[am/pm]	Select am, pm, Z or tab for 2400 hour clock. The current configuration time zone is
AMBER	A child Missing, Broadcast Emergency Response (named after a child named Amber)
(Area] [City] [County] [State)	May be derived from a map location area selection.
[content]	content
{County1] [State1} to {County2} {State2}	range of the issue
(Dam)	The name and number of the dam
{Date} {Incident_Time}	Computer inserted default value
[Day]	This may be entered by name and the date calculated from Incident_Time and stored as such. F
[describe_measures]	
[Describe the incident and its consequences].	
[Describe incident in layman's terms]	
[Describe_location]	
[Describe the incident, hazard and its consequences].	
{Description of organization}	e.g. a water supply company or authority
{description of organization if applicable}.	e.g. a water supply company or authority
(Details)	may be as {Details}
[Direction and Street/City Location].	
{dyke or levee}	select appropriate name
[endDate]	This is decided by the weather forecaster or other Subject Matter Expert
[EndTime]	This is decided by the weather forecaster or other Subject Matter Expert, or the assment with cor
[endDay]	This may be entered by name and the date calculated from Incident_Time and stored as such. F
[Event/Hazard]	
[events]	may be as {events}
[facility]	facility name
[food]	food or drink
[found_City found_State]	
(further details)	may be as {further details}
[Gender]	Apparent gender of person described
[Hair Color]	Apparent hair color of person described

The items SHOULD be in italics in the origin

[He/She]	Select appropriate apparent word
[hh:mm] [am/pm] [Day]	manually estimated end time, if 24:00 clock is used, the pm is omitted. The Day may be omitted.
[hh:mm]	a duration time, e.g. ultraviolet exposure
{hh:mm} {am/pm}.	end time calculated from Message_Duration (not audio_Duration) and Incident_Time
[hospitalName]	Name of hospital
HVAC	Heating, Ventilating, Air Conditioning and Refridgeration
{Incident_Time} {Day}	Computer inserted default value
[lake effect snow/marine cold air outbreak]	select appropriate term
[location]	name or description
[Material]	name the material which may be hazardous
(man/woman)	enter as apparently appropriate, not a legal definition
{Message_Duration}	Time duration for which the message is applicable
{mm:ss}	calculated tiem eg.g for earthquake arrival
[name]	name of item
{natural/coal}	redefine as relevant per jurisdiction
[non-emergency_number]	
NOTAM	Notice To Airmen
[Nuclear_Power_Plant_Name]	
{Official_Government_Agency}	The agency authorized in this State to issue such alerts. When there is only one such agency, the
[Other]	other
[person or item]	describe in more detail
[Probability=nn%]	the percentage probability of precipitation (snow flurries may be 0)
[rain/precipitation/waterway]	select and translate as relevant
[Recommended Action]	user advice
[Recommended actions and extended/further instructions]
